

Installing Portal Certificates

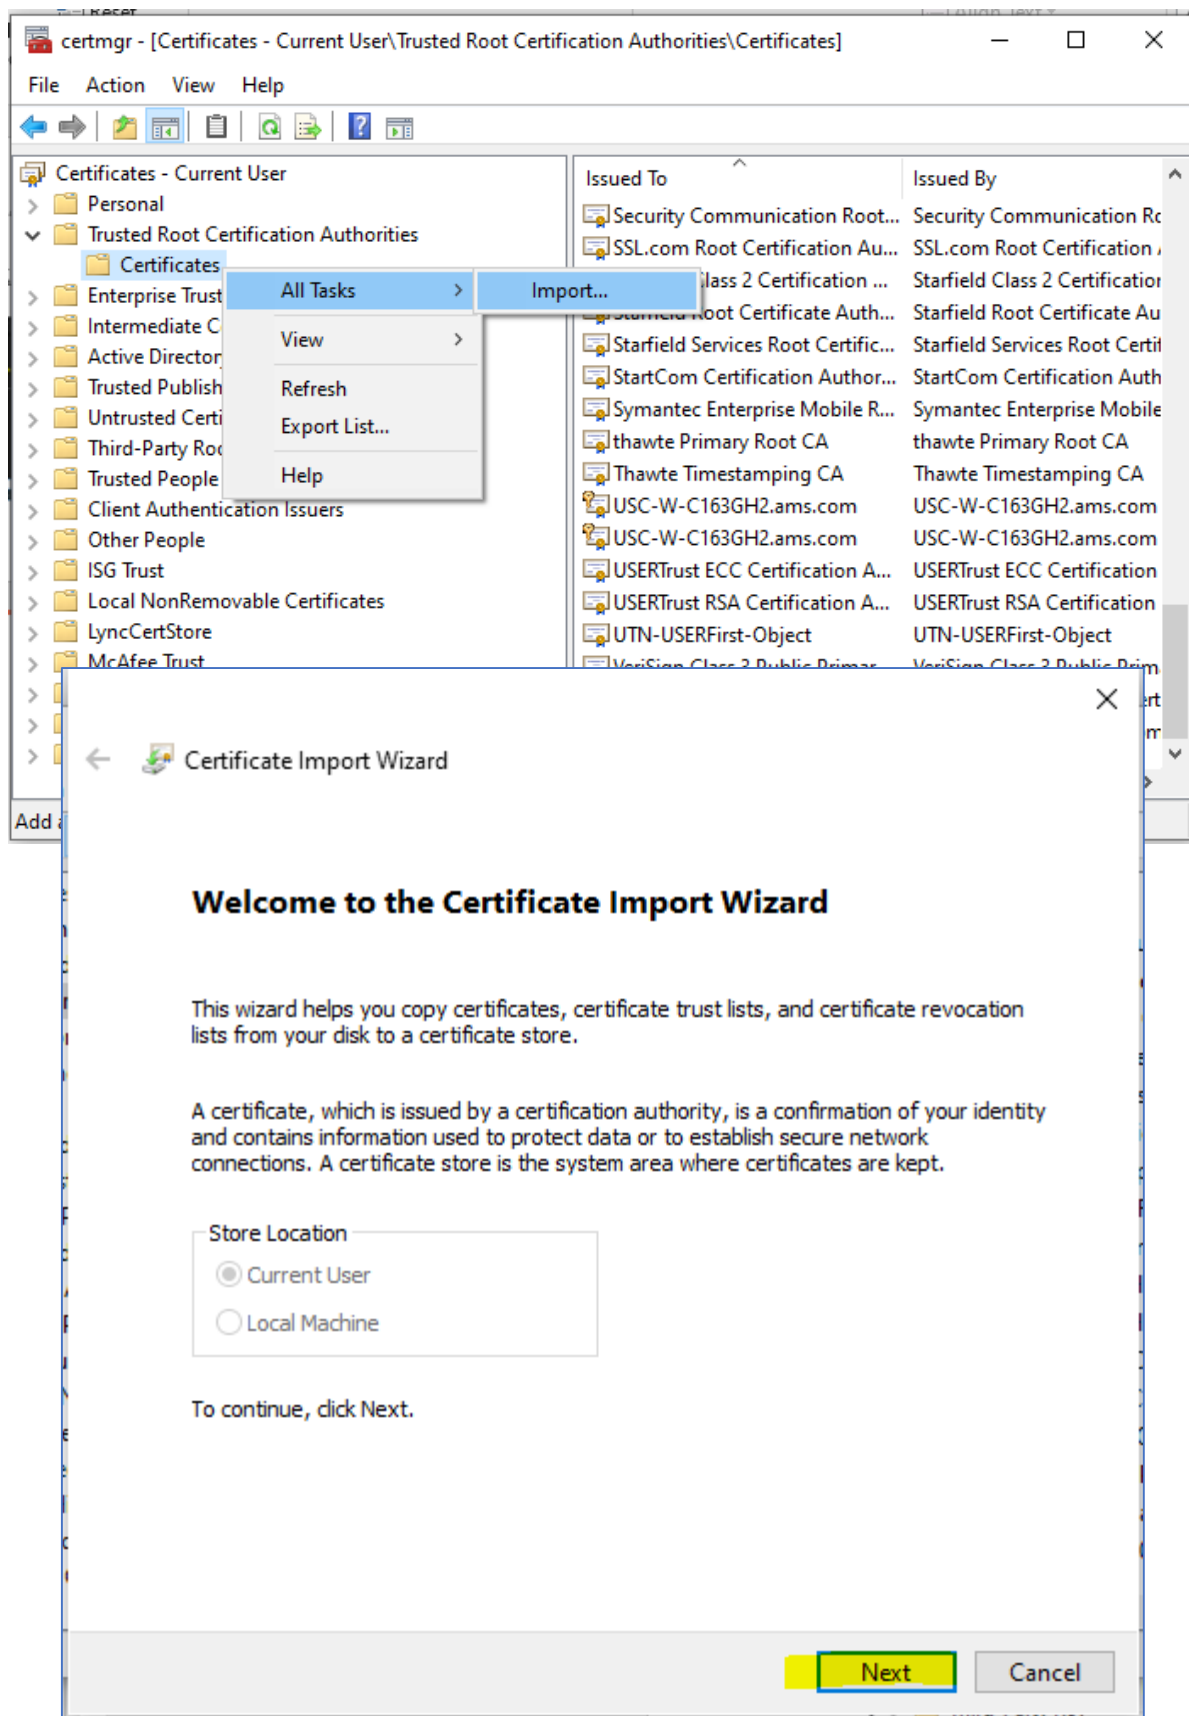

- Download the correct certificate to your local machine.

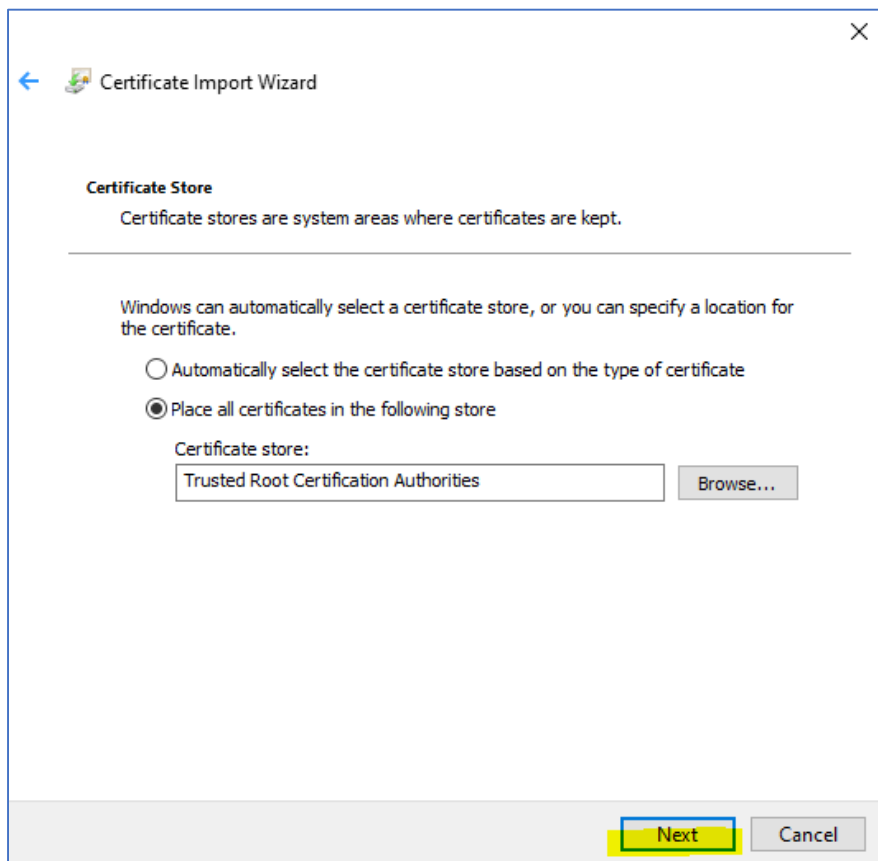

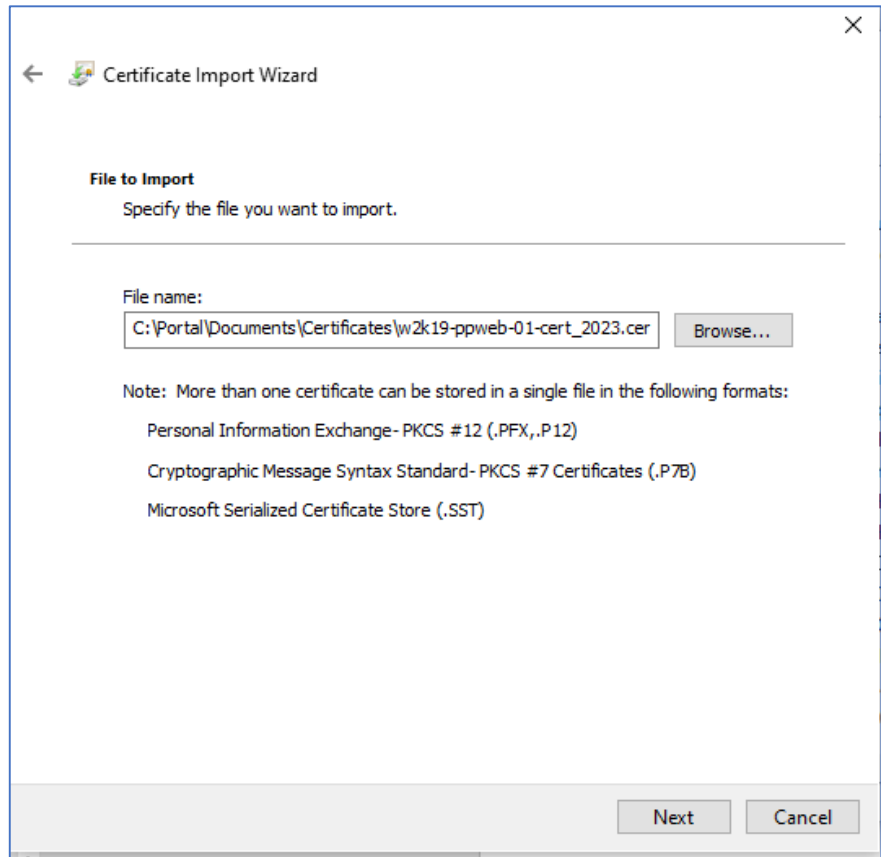

- Open the Certificate Manager by searching your machine using the word “certificate”. The certificate manager takes some time to actually start so be patient.

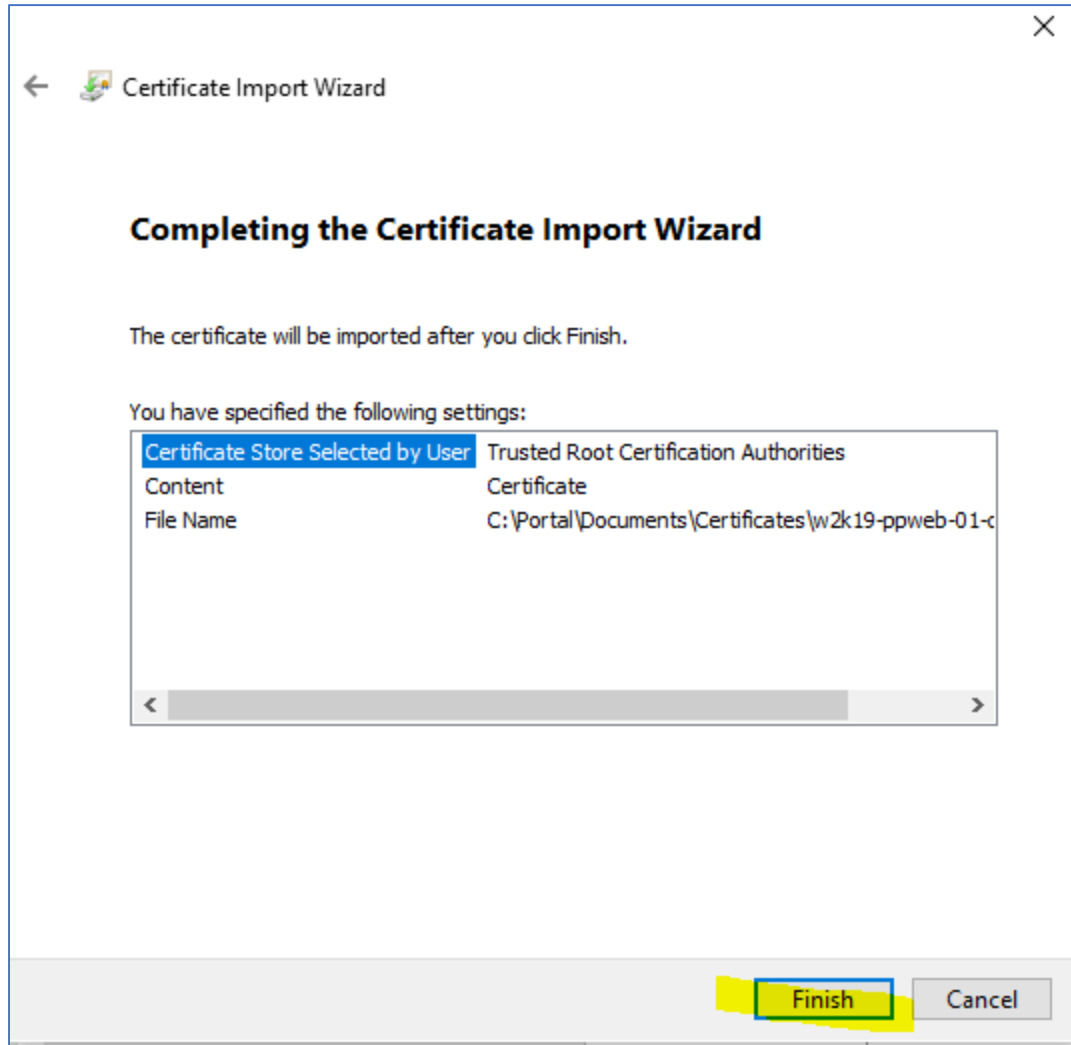

- In the Certificate Manager, open the *Trusted Root Certification Authorities* folder. Then right-click on the *Certificates* folder under it. Choose *All Tasks*, then *Import*.

- Continue with the wizard by Browsing for the location of where you put the certificate.

- Click Finish to install the certificate. You should get a successful installation message.

- After installing, wait about 5 minutes, then make sure you are on the RNAS environment and have clicked the GTOUS count down link. Start your services and your front-end code and try to run everything locally to login and see data.
